

Automatic Security Doors

Security and control for your company's essential assets

Kardex Remstar offers an Automatic Security Door for Lektrievers which provides various levels of Security and Control to protect your essential corporate assets helping to ensure that your organization stays on the right side of the law observing the regulatory guidelines for your business sector.

Security Level 1

Supervisory pass-code or PIN number(4 digits). This allows only one individual to open the Lektriever in a department at the beginning of each working day. Assets of this nature are usually in a restricted room with limited access and all department employees have access to any of the stored materials.

Security Level 2

This offers individual pass-code protection. It is mostly used when the Lektriever is located in a non-secure area, but only a department's employees are permitted access to stored materials. Up to 25 individual user PIN numbers can be allocated allowing access to secure assets. Once the transaction is complete the door can be closed by the operator or automatically close after a predetermined amount of time.

Security Level 3

This limits individuals with PIN numbers to specific shelves within the Lektriever. When a unit is shared between departments individuals are restricted to pre-authorized levels set by an administrator. The operator inputs his unique PIN number into the control, once approved he can select a carrier. The unit will then rotate with the security door in a closed position. Once the selected shelf is delivered to the access opening behind the closed door, the door will open allowing the operator to access only the shelf selected. Once the transaction is complete the door can be closed by the operator or automatically close after a predetermined amount of time.

Security Level 4

If the application warrants the utmost security, the Automatic Security Door can be integrated with software for the strictest confidentiality. The "track and trace software" logs all picks and restocks, by user and generates audit reports on all activities.

Additional Options

Locking shelves with the Lektriever Electric Lateral File

For applications where there is a need for additional security within the Lektriever. It is possible to fit individually lockable compartments within one shelf where highly sensitive items and files can be stored securely. This could include such items as senior management or confidential files and project folders as well as items requiring additional safe keeping due a higher value.

Disabled Persons Accessibility

Linking the Automatic Security Door with the electric posting board offers equal working opportunities for all operators enabling them to work effectively and making the task fit the person performing it without overly stressing the person's abilities or limitations. This maximizes productivity and efficiency for all employees by reducing worker fatigue and discomfort.

Fire Protection Systems

Connecting the Automatic Security Doors to a facility's fire detection system can provide additional protection. Heat and smoke sensors fitted to the Lektriever can trigger the automatic closure of doors in the event of a fire. Dependent upon the organisations fire policy, the fire suppression system will be activated within the Lektriever to protect the contents.

Lektriever Lateral File Range Benefits at a glance:

- Save up to 70% of valuable floor space
- Increase productivity by 160%
- 100% ergonomic access to all contents

Combination Options

Multiple combinations of automatic security doors, electric posting boards and fire protection and "track and trace" software reinforce the overall core benefits of the Lektriever Electric Lateral File range.
